

The **HEAD VENT SYSTEM**

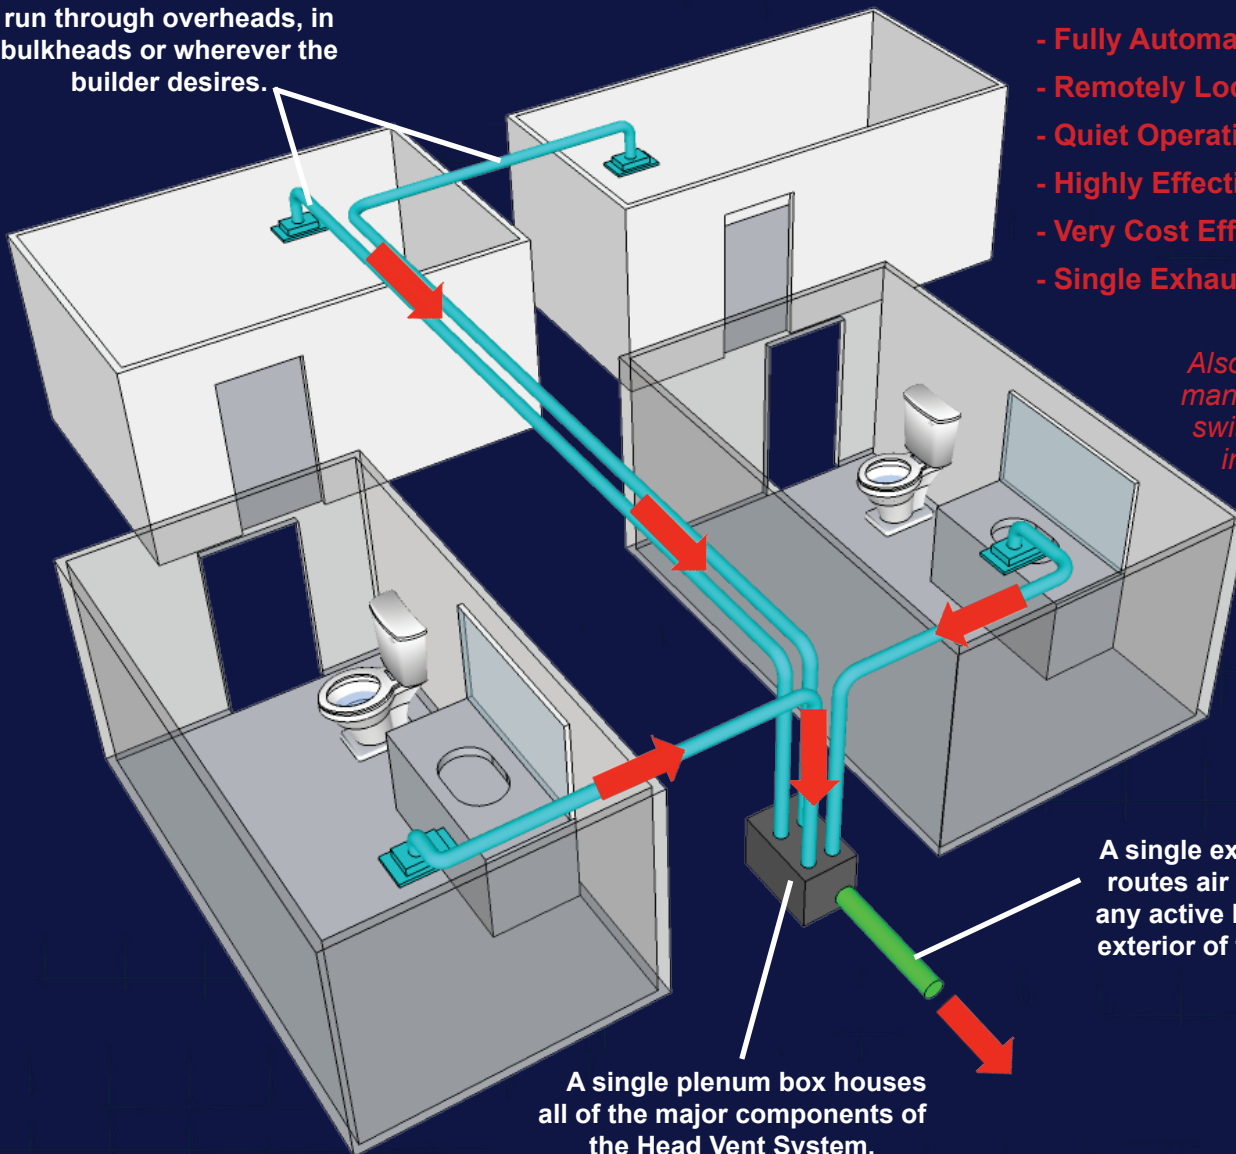

DELTA "T" SYSTEMS

Automatic Marine Head Ventilation System

When a person enters the head, a motion sensor initiates the Head Vent System and starts the flow of air. The system then remains active while the head is occupied, and continues to run until several minutes after the head has been vacated.

Dedicated 3" ducts can be run through overheads, in bulkheads or wherever the builder desires.

- Fully Automatic Operation
- Remotely Located
- Quiet Operation
- Highly Effective Air Extraction
- Very Cost Effective
- Single Exhaust Port on Vessel

Also available as a manual system with switches mounted in each head.

A single exhaust port routes air from from any active head to the exterior of the vessel.

A single plenum box houses all of the major components of the Head Vent System.
